

Scenario:

You are a single parent that works for most days of the week. In between working and taking care of your children you worry about not having enough money to support your family. You have searched for an app online and have just downloaded the app “Expense Manager” to help you monitor your expenses.

Task 1: Create a new file titled “[First Name]’s Monthly Income.”

Task 2: Fill in expenses and create a spending limit of saving \$100 for one week and spending less than \$500 for one month.

Task 3: Give a rating, comment and share with a friend. (Note: I’d have to extend my prototype to do this.)

Notes

What changes you should make to your application (min two things):

1. An address does not seem necessary for personal information on an expense management app.
2. Add how often does a particular user visits their favorite shop and how much do they spend there.
3. When creating a spending limit, it is not clear what that part of the app does. Needs clarification that you are setting aside money for those expenses.
4. Add an option for a monthly spending limit along with a weekly limit.
5. There should be a list of potential tips and methods for limiting one’s spending when creating a spending limit.
6. Needs a way of notifying the user that they have met their goal.
7. Add an option to rate and comment the app.

What you need to keep the same for your application (min two things):

1. Keep the necessities, hobbies, luxuries, emergency and other in accounting for the spending limit.
2. The option of setting weekly and/or monthly goals.
3. Favorite shops could allow a user to keep track of how much they spend at a particular place.
4. Keep the share with friends feature.
